COMMON ASSESSMENT TASK

Level 2 Digital Technologies and Hangarau Matihiko 2025

**91899 Present a
summary of developing a digital outcome**

Ngā Kaiako o Hangarau Matihiko Aotearoa
DIGITAL TECHNOLOGIES TEACHERS AOTEAROA

DERIVED GRADE

Credits: Three

Achievement Criteria		
Achievement	Achievement with Merit	Achievement with Excellence
Present a summary of developing a digital outcome.	Present an in-depth summary of developing a digital outcome.	Present a comprehensive summary of developing a digital outcome.

Type your School Code and 9-digit National Student Number (NSN) into the header at the top of this page. (If your NSN has 10 digits, omit the leading zero.)

Answer all parts of the assessment task in this document.

Your answer should be presented in 12pt Arial font, within the expanding text boxes, and may only include information you produce during this examination session.

You should aim to write between 800–1500 words in total.

Save your finished work as a PDF file with the file name used in the header at the top of this page ("SchoolCode-YourNSN-91899.pdf").

By saving your work at the end of the examination, you are declaring that this work is your own. NZQA may sample your work to ensure that this is the case.

You may only access the digital outcome and Common Assessment Task. Internet access is not permitted.

2025 DERIVED GRADE EXAM ONLY

INSTRUCTIONS

The task in this assessment requires you to discuss a digital outcome you developed within the past 12 months.

You must illustrate your answers with three images (JPG or PNG) you have prepared in advance:

- a single image of the digital outcome (e.g. a website, a magazine spread, an electronic device)
- a single sample image of a digital component of the outcome in the software used to create it, for example:
 - the HTML/CSS for a website in a text editor (e.g. VS Code, Notepad++)
 - the 'layers' view of a vector or raster graphic (e.g. in Inkscape/Illustrator, GIMP/Photoshop)
 - the source code for controlling an electronic device (e.g. in Arduino C, PBasic)
 - the CAD/CAM file for a 3D model (e.g. in Blender, Fusion 360, SketchUp)
 - the source code for an application in a suitable text editor (e.g. VS Code, Replit).
- a single image of your development process (e.g. agile development, a planning chart).

During this assessment, you may access only the three images you have prepared in advance. You may not access your digital outcome, any other online or paper resources, or the internet.

If you developed your digital outcome as part of a group, you must write about your role and specific contributions to the project.

Read all parts of the task before you begin.

ASSESSMENT TASK

Name the type of digital outcome you created (i.e. website, app, magazine, animation, etc.)

Portfolio Website

(a)(i) Insert the image you prepared of your finished outcome (what the end user sees).

Name the main software you used to create the digital component of your outcome (i.e. Fusion360, Blender, VS Code etc.)

Visual Studio Code

(ii) Insert the image you prepared of a digital component of your outcome in the software used to create it.

(iii) Insert the image of your development process that you have prepared.

Describing Your Digital Outcome and Development Decisions

(b)(ii) Describe the digital outcome you developed. What is it? What is its purpose? Who is it for? What are its key features and functionalities?

The digital outcome I have developed is a portfolio website about my photography. The purpose of my portfolio website is to showcase my photography journal as a beginner photographer student, take notes and give useful information about camera and its history, and to showcase my own photographs as well while giving useful tips.

My end-users are:

Me: so, I can take notes from what I have been doing in my photography class. And, to see and look for my skill improvements.

Family and Friends: To brag about my skills in photography and website development. For them to guide me as well for giving updates feedback on how my websites looks.

Fellow photographers' classmate: To help them gain more information from my notes and to check out my images as well.

The key features and functionalities of my website is that it is user-friendly, visually appealing, and technology functionable. All my elements are responsive, especially my images. And my navigation menu is not the boring usual 3 lines. It is called navigation-icon-popups, that I made draggable. My background is not boring either. I made an animation background pixel art, combined with a toggle theme icon of moon and sun for light and dark mode.

(ii) Explain TWO key decisions made during development that relate to any of the following:

- **Tools and techniques:** What software, programming languages, platforms, or design methods did you choose and why?
- **Consultation with subject-matter experts:** Did you consult anyone with specific knowledge or expertise? If so, who and how did their input influence your decisions?
- **Testing and trialing with particular people or groups:** How did you test or trial your outcome in its early stages, and with whom? What did you learn from this?

Decision one: Tools and techniques / Consultation with subject-matter experts / Testing and trialing (*highlight the one you have chosen*)

I used my progress weekly log document + Trello boards combo, to decompose all my big elements into manageable components. With the help of Trello boards, I was able to decompose my big plans. For my progress weekly log, I was able to see and be consistent on my progress in my developing. This is where I can see my progress, of what I have achieved and changes I made, and plan my next big plan. And after that, I'd use my Trello boards, to check all the list requirements for my website elements component: such as main page file, navigation-icon-popups, files where my iFrames are, and files for my images, HTML, CSS, and their functionality (JavaScript). This combo helps me maintain a good habits of checking my websites updates and be consistent to all of my design.

The programming languages I used were just the basic: HTML, CSS, and JavaScript. HTML, for my contents to be. Title/Headers, Body for my images and text/paragraphs. CSS, so that I can design my contents such as color scheme of my website, alignments, and spaces. I used JavaScript for functionality of my navigation menu or what I called 'navigation-icons-popups'. To make them draggable and be able to popup and popout. I used @mediaqueries to make my images responsive. To make all my elements responsive. My whole website. I also used grids to fix my images as a portfolio images. And with the help of JavaScript, I was able to make it bigger when the image is click by users.

While designing and developing, I asked for my best-friend/digital-tech classmate (Phyu) for feedback on how my website look like to her. She gave me honest feedback. She said that she liked on how cool the functionalities of my website are, but something is missing. She said that the plain background "looks quite dull and boring" and suggested me "a moveable background or any images?" And that leads me to a great idea. I already have a plan about pixel art background ever since, but I was too scared to try it out since it seems hard at first and decided to let go of it. But Phyu just motivates me to try it out for the sake of my best visual appearance of my website. I asked permission to my teacher, Miss Simmond if we are allowed to use someone's pixel art. Since I don't have much time left to design. And she said yes, but to make sure that it is in public domain or have the artist's approval. And I know just someone who fit the details. My sister. She graduated as a Bachelor of Computer Science and currently working as an android developer and used to be a digital artist. I asked for her help to make me two-pixel art design. I gave her descriptions on how I want it to look like. Simple garden looks, for both light and dark mode. And fortunately, she had made it before, just like how I exactly want it. Problem solved. I made it looks like it moving in my main page as a background, with the use of JavaScript again. And made it responsive using @mediaqueries.

During the trialing and testing phase, I always considered my end-users opinions and take seriously their feedback. I sometimes used my sister codes, and from the other YouTube tutorials when designing my website. Especially JavaScript. Not exactly same code, since I liked exploring and experimenting my codes to make something I want. Sometimes they don't work. But it's still a win-win situation since I did learn a lot from it. Also, we have a list of requirements to tick of if our testing is a fail or pass---provide in a google document, thanks to Miss Simmonds for making our lives easier and less hassle.

Decision two: Tools and techniques / Consultation with subject-matter experts / Testing and trialing (*highlight the one you have chosen*)

I used GitHub and Visual Studio Code combo, so that whenever I made changes and updates in my website and something unexpected happen, I can always look back on all of my commits to bring the version back that I want. Also, with the help of GitHub, I can make my on-going developing website into a whatsoever called "public" or "domain" which when I can copy the link of my websites https and share it to my end-user and ask them for feedback from time to time.

When I was designing at early stage of my development, I made a lot of mess. My navigation BARS are not that align with my other elements. It doesn't look good, the way I imagine it to be during design plan. And that lead me to a big decision. Make a new design for main page.

I changed a lot. During these changes, I disregard my old page structures. When I was designing my website outcome looks, I both used my notebook and pencil for sketching and Figma for digital designing.

Since I couldn't make my navigation BARS's align with my images below, and the spaces aren't even and so ugly: It leads me to a cool idea of my now called "navigation-icons-popups." This idea was inspired by my inspired websites from shar's desktop. A random youtuber that I have watched when I was researching for learning to design a website. With the help of Miss Simmonds, I learnt to inspect the website's code and tried to learn and applied it to mine. Luckily, I got it the first try and tried to make changes for my own design. I used iCloud icons for it. But in my first icon popup is not from iCloud, it was my own design---my logo. So basically, my main page or main header as I would say simply represents as my footers as well. As it has my social media links provided already + my CTTO credit text.

These navigation-icon-popups has a lot of functionalities. I used CSS to add hovers on them. JavaScript to make them switch colours for light and dark mode. To make them draggable, and removeable as well. Media queries to make them responsive as some of them are inside of the iFrames.

I asked feedback from my two boy bestfriends, one of them is my model, asking them about thwe colour scheme. If it fits the background animation pixel art. And they said it looks so good. And that made me satisfied my worked. For trialing and testing, it passed all the requirements. Check for Responsiveness, Visual Appealing, and Functionality.

Addressing Requirements and Implications

This section will require you to to focus on how the aesthetics, functionality, cultural and/or ethical, sustainability and/or future-proofing, usability, and end-user considerations were considered during development of the digital outcome.

Obvious implications	Implications that affect the user directly	Less obvious and/or wider implications
Aesthetics Functionality	Usability End-User Considerations	Sustainability / Future-proofing Cultural / Ethical

(c)(i) Name one of the most important requirements of your digital outcome.

Functionality

(ii) Name the implication (*choose from one in the table above*) that best relates to the requirement named above in (i)

End-User Considerations

(iii) Discuss in detail how your digital outcome addressed the specific requirement named in (i), keeping in mind the implication you identified in (ii). Provide specific examples of the steps you undertook and how you implemented these to meet this requirement and implication.

Functionality is making the website be able to work. If the website is not that functionable, my end-users will not be able to use it or might frustrate and irritate them leading them not to check and comeback to see my website.

My digital outcome has been addressed functionality on it. By the help of considering my end-users suggestions and feedback I was able to make my website functionable. Not just the way I want it to be, but also their part of giving me ideas based on their opinions as well. Considering my end-users are very crucial in the part of my developing. Because my digital outcome will be nothing if my end-users are not included. They will feel that they don't like how it functions and lead them not to check and comeback again to see my website. One of the considerations I made from my end-user is from my friend, Phyu. She didn't like how boring the background of my website at first and suggested me something that lead me to a cute functionable website. If I did not considerate her feedback, I wouldn't think of adding the animation pixel art background + toggle theme icons. And my website would have remained not that much interactive, visual appealing, and functionable.

(iv) Name ANOTHER implication (choose **another implication** from the provided list that represents a *different type of consideration*) that you had to consider during the development of your outcome

Usability

(v) Name a different requirement of your digital outcome that relates to the implication named above (iv).

Aesthetic

(vi) Discuss in detail how your digital outcome addressed the specific requirement named in (v), ensuring you explain how the implication you identified in (iv) was considered and implemented. Provide specific examples of the steps you undertook and how you put these into practice to meet this requirement and implication.

My digital outcome has been addressed aesthetic on it. I made sure that my overall website design looks good, not just by my eyes but for my end-users as well. The fonts of the texts I used are all readable at the right size and type. The paragraphs and sentences are all grammatically correct. My images are not massive; they are the right amount of size. And if the users are not satisfied, if its too small for them, they are able to tap the images, and it will be big enough for their screen size. The alignments and spaces are even. Not that messy. Not that spacey.

There was a thing though. On my main header, my introduction text is in lower caps. Miss Simmonds pointed it out to me. It was intentionally. As I was trying to make it the same on my inspired website. Using lower caps made my website seems more user-friendly, and as a Gen Z it seems cuter to us. If the comma is in the right place, it looks good. Since my end-users age range are close to mine, I know they wouldn't mind it. I also asked for feedback to make it sure, and it didn't bother them. But of course, I made sure that I capitalized the right letter in my other contents. Because they are all formal

text as it about History and my photography tips. Only the introduction text is in lower caps. But all the formal text are in the right capital text.

By checking all the requirements for usability with the help of my end-users' feedback and Miss Simmonds's opinions, I successfully made my website into a visually appealing or I could say an aesthetic digital outcome.

Evaluating Development Decisions and Future Improvements

(d)(i) Reflect on the overall development process of your digital outcome. Think about the strengths, weaknesses, and overall effectiveness for a key decision you made, and judge:

- the direction this decision took your digital outcomes development in
- whether it helped, challenged or constrained making your project in depth and detailed
- what unique or significant opportunities came from this decision
- what insights you gained and the overall impact this decision had on your development process

The strengths of my website are the components of my images. Especially my portfolio images. They are all place and aligned well. They are responsive, and clickable. Since it is a portfolio website, my end-users will obviously tend to focus more on my images. Which is why I had to code it good.

My other components that turn out to be good as well are my popups and their contents. They not only designed well but also tend to have a deeper significance. Since my text information are all about what I have learnt and tips in photography which my end-users can take notes from.

Overall, I was proud and contented to how my digital outcome turns out to be. The big plans, changes, and all my decisions shaped my website. Not just my website, but my skills and my personality. I learnt to considered people's opinion and suggestion for me to improve and my website. Which I kind of don't take that much seriously before, since I'm an independent type of person who relies on my own perspective alone. But yeah. I learnt that it wasn't that hard to hear about their opinions. It led me to a success digital outcome.

By listening to my friend's honest opinion, and my teacher's suggestion made me consider a lot of things. And all our intention is the same, for best digital outcome. So, it didn't really hurt me anything at all when they are giving me honest feedback. Since its for me and my website anyway.

All my elements in my website were purely made of love, hard work, and honesty. To me, this digital outcome is not just a project but a practice learning tools for me to shape my digital developing skills and being able to communicate both with end-users and myself through programming language.

(ii) Looking back at your project, name at least two key decisions you made that you would do differently now. For each decision, explain *what* specific changes would you make, *why* you would change it, and *how* the change would improve your digital outcome referencing the impact it would have on the outcome's aesthetics, functionality, cultural/ethical considerations, sustainability/future-proofing, usability, or end-user experience.

If I were to be honest, I did use my progress log and Trello combo that much at some point on the weeks where I have to priorities my other major subjects, that lead me to procrastination in the last 2 weeks of my development. I was able to make my elements visually appealing and responsive. But for some cases, for smaller screen size my other navigation-icon-popups like the "link" and "contact" popup. They are draggable, and response well in all the screen except one type of phone screen size. The iPhone XS something. I realised it too late. I don't have time anymore to update it since it was passing due date anyway. But yeah, one of the things that I learnt is to not procrastinate. Always check the designs and functionality of each element in different screen. That would be one thing I will check for future improvements. Improving this will allow me to feel more confident and satisfied on how my digital outcome turns out to be. Since this is the only one, I regret that I didn't have the chance to do.

Secondly, I could have made my popups-iframe's resizable as well. So that it's up to my end-users how responsive they want my website to be. Same reason from the first one. Phyu suggested this to me, but there was only half an hour before the due date. So, I just decided to let it be. My popups are responsive enough anyway. But the thing is that they are overlapping to each other when viewing in smaller screens, but they can be removed anyway. Oh, the thing is that, in smaller screen my popups are not draggable. Only in desktops and bigger screens they can be draggable. This one as well. For future improvements.

These improvements would improve my digital outcome by adding more functionality, and interactivity for my end-users' experience of my website. Since one of my improvements are suggested by one of my end-users, this is a big impact to add in my end-users considerations and sustainability as well. Not just my users can only view my website in full screen, but they could have also resize my web to minimise it and look into other apps by not just focusing on my website. Which is convenient.
